Course Code: ITA1416

Slot: B

Course Name: ETHICAL HACKING

Course Faculty: Dr. Rameshkumar K

Project Title: A hospital was hacked with ransomware, disrupting patient care. Should organizations be allowed to pay the ransom to restore services

Module Photographs:

Project Description:

Ransomware is a type of malicious software (malware) that encrypts or locks a victim's files or computer system, making them inaccessible. The attacker then demands a ransom, usually in cryptocurrency, in exchange for a decryption key to restore access. Ransomware commonly spreads through phishing emails, malicious downloads, or software vulnerabilities. It can severely disrupt organizations such as hospitals, businesses, and government agencies, causing financial losses, operational downtime, and potential data breaches. The best protection against ransomware is regular data backups, updated software, strong cybersecurity practices, and user awareness.
